

This application is developed in JAVA using Netbeans IDE 8.2. It implements JAVA Swing to build the GUI. The application database is built using MySQL workbench and uses JDBC connector to make the connection in the code.

The source code along with all other files is included in the zip folder. Unzip the folder, copy the files in your system.

To change the DB connection username and password, open ContactFrame.java file and make changes in the Connect() method.

```
public static Connection connect() throws SQLException {  
    Connection conn = null;  
    try {  
        String USERNAME = "root";  
        String PASSWORD = "Welcome@123";  
        String CONN_STRING  
"jdbc:mysql://localhost:3306/PhoneDirectory?autoReconnect=true&useSSL=false";  
        conn = DriverManager.getConnection(CONN_STRING, USERNAME, PASSWORD);  
        System.out.println("Connected!!");  
    } catch (Exception ex) {  
        System.err.println(ex);  
    }  
    return conn;  
}
```
